

TR250 Stripe Instructions

After Considerable time and effort we have determined that it is not possible to produce an easy-to-use paint mask. Due to the compound surfaces involved, it is virtually impossible to apply a flat die-cut mask over compound curves without wrinkles and distortion. The easiest way to duplicate the original stripe is to use 3/8" wide masking tape to lay out the stripe outlined on this sheet. The exact angle of the front fender stripe and the location of the hood stripe is not critical, as it is slightly different on the 3 original car that we studied; although the basic stripe dimensions were virtually the same. It is important to have all of the gaps in the stripe uniform and free of waves. The stripe does come to a slight radius at the center of the forward edge; this radius is approximately 8".

When Masking the hood you should measure 5 7/8" back from both outside edges to establish the outside leading edges of the stripe. Then, from the center point of the hood, measure back 5 1/2" to get the leading center edge of the stripe. The outer stripes should measure 5/16" wide with 3/8" between the outer and inner stripes. The center stripe should measure 2 5/8" (4" overall). When you are ready to mask the fender stripe the leading edge should be 5 7/8" back from the leading edge of the fender (A). Find the bottom edge of the valance panel (B), and from that point measure up 13 1/4" along the fender opening to locate the leading edge of the stripe at the fender (C).
